QUESTION: Regarding Page 2 of the bid in the section titled "Free Product Investigation": The borings to be converted to free product wells (PW) are to intersect the water table, however, the total maximum depth specified at the end of this section is 25 ft bls. The bid states (elsewhere) that the water table ranges from approximately 12 ft - 13 ft bls in the source area, to between 7 ft and 9 ft downgradient of the source. Given this, a 25 ft total depth for these wells would result in a screen below the water table. How deep should we go?

Answer: The maximum total boring depths for the product wells should be no greater than 20 ft (not 25ft).
